Import Libraries

In [9]:

```
import pandas as pd
import pyarrow as pa
import pyarrow.parquet as pq
import glob
import dask.dataframe as dd
```

Function to read CSV files

This can be more enhanced using parameters if needed rather than writing new code

In [16]:

```
def read_csv(filename):
    return pd.read_csv(
        filename
    )
```

Start of main analysis

Reading the entire forlder for CSV files

In [15]:

```
files = glob.glob("data/*.csv")
files
```

Out[15]:

```
['data\\weather.20160201.csv', 'data\\weather.20160301.csv']
```

Mapping all the CSV files to our function

In [18]:

```
dfs = list(map(read_csv, files))
dfs
```

Out[18]:

```

Use the first table to create schema for the writer

In [19]:

```
table = pa.Table.from_pandas(dfs[0], preserve_index=False)
writer = pq.ParquetWriter('weather-rowgroups.parquet', table.schema)
```

In [21]:

```
table
```

Out[21]:

```
pyarrow.Table
ForecastSiteCode: int64
ObservationTime: int64
ObservationDate: string
WindDirection: int64
WindSpeed: int64
WindGust: double
Visibility: double
ScreenTemperature: double
Pressure: double
SignificantWeatherCode: int64
SiteName: string
Latitude: double
Longitude: double
Region: string
Country: string
```

Using Writer and the dataframes to create table

In [22]:

```
for df in dfs:
    table = pa.Table.from_pandas(df, preserve_index=False)
    writer.write_table(table)
writer.close()
```

Some analysis on the parquet file and its row groups to identify characteristics of our data structure

In [23]:

```
filename = "weather-rowgroups.parquet"
pq_file = pq.ParquetFile(filename)
```

In [24]:

```
data = []
for rg in range(pq_file.metadata.num_row_groups):
    rg_meta = pq_file.metadata.row_group(rg)
    data.append([rg, rg_meta.num_rows, rg_meta.total_byte_size])
data
```

Out[24]:

```
[[0, 93255, 537181], [1, 101442, 560608]]
```

In [26]:

```
# To get number of rows
pq_file.metadata.num_rows
```

Out[26]:

```
194697
```

In [27]:

```
# To get number of columns
pq_file.metadata.num_columns
```

Out[27]:

```
15
```

In [28]:

```
# To get metadata of column
rg_meta.column(7)
```

Out[28]:

```

Find min and max statistics of a column for each row group

In [29]:

```
column = 7
data = [["rowgroup", "min", "max"]]

for rg in range(pq_file.metadata.num_row_groups):
    rg_meta = pq_file.metadata.row_group(rg)
    data.append([rg, str(rg_meta.column(column).statistics.min), str(rg_meta.column(col
umn).statistics.max)])

print(data)
```

```
[['rowgroup', 'min', 'max'], [0, '-99.0', '15.6'], [1, '-99.0', '15.8']]
```

In [30]:

```
rg_meta.column(column).statistics.max
```

Out[30]:

```
15.8
```

Using the maximum tempreture to filter our tour data and columns to avoid fetching extra data and limit the load to what we really need.

In [10]:

```
df = dd.read_parquet("weather-rowgroups.parquet", columns=['ObservationDate', 'Region',
'ScreenTemperature'])
```

```
C:\Users\Sam\anaconda3\lib\site-packages\pyarrow\compat.py:24: FutureWarni
ng: pyarrow.compat has been deprecated and will be removed in a future rel
ease
  warnings.warn("pyarrow.compat has been deprecated and will be removed in
a "
```

In [11]:

```
df = df[df.ScreenTemperature == 15.8]
```

In [12]:

```
df.compute()
```

Out[12]:

	ObservationDate	Region	ScreenTemperature
147768	2016-03-17T00:00:00	Highland & Eilean Siar	15.8

Result

Hottest day = 2016-03-17T00:00:00

Tempreture on that day = 15.8

Region = Highland & Eilean Siar

In [ ]:

```

```
